

product vision *document*

Every time we give any command to an AI agent, whether it is to an LLM to clear a doubt, to generate an image, or whatever the end product is, we feel dissatisfied with it very often and start thinking that there is something wrong with our commands. This makes us adapt ourselves to what the LLM needs in order to deliver a better result.

Thus, Kivi should not just bridge the gap between our thoughts and execution, but also to act as a natural input layer of computing, with our voice working the way we normally use it, to think, speak and work in our own indic slangs.

taking a *position*

a. What should Kivi mean?

As I've mentioned, most Indian users have adapted to the computer's terms and conditions to get better results, even for simple tasks. I want Kivi to reverse that relationship by understanding our language and making speaking a true alternative to typing without the hassle. This depends on what happens between the words we speak and the words that appear on screen.

Kivi should not just capture words. It should understand context, intent and tone, acting as a companion that understands what we mean, not just what we say.

b. To whom should Kivi belong to?

Kivi should primarily serve two sets of users:

- a) Everyone in the world who thinks faster than they type.
- b) People in India who believe that their thoughts are being undermined by their computers purely because of a language barrier.

Kivi should get into every Indian household by leveraging both our multilingual, code-switching advantage and the fact that there is no other indigenous competitor like Kivi in our home turf right now. The plan only truly succeeds if it reaches and engages even with non English-speaking commoners in the villages of India and gets genuine feedback from them. And the faster Kivi reaches platforms like iOS and Android, the faster our growth.

c. 'The Value' and 'Why would someone keep Kivi?'

Every second spent dictating saves roughly two seconds to typing, while Kivi's post-processing reduces the effort of switching keyboards, translating thoughts, and fixing typing mistakes. For a multilingual country like India, where friends and relatives constantly switch between languages, Kivi can make communication far more natural by understanding the way we actually speak.

And in the near future, I think Kivi should learn every terminology, nuance, tone, and pattern that makes communication between users even more natural and convenient. Basically, it should keep getting better at understanding what we mean from us.

d. What must Kivi refuse to become?

i) Kivi must refuse to become a voice assistant. Kivi should help when we need to work, produce or create something, rather than answer random questions when I'm too lazy to do it myself. It should connect multiple workflows through voice by understanding the surrounding context and our intent.

ii) With a brand like Sarvam backing Kivi, I feel it must refuse to become just a cloud-only model. Having an offline model, even if comparatively less accurate but specifically curated, could help us work with organisations that prioritise data and privacy, while making Kivi not just indigenous, but truly sovereign.

in the *Future*

my additional thoughts....

Currently, Kivi is just a dictation interface that understands what we say. But I wish to see it evolve into a computer interface that eventually understands what we are trying to accomplish. Think of it in this way - instead of opening WhatsApp and dictating what we need to text, you simply say on the desktop, “Text Karthik that I’ll meet him in 10 minutes at the institute library,” and Kivi opens WhatsApp, opens Karthik’s chat, and sends him the text, “Bro, I’ll see you at the institute library in 10 mins.”

It should become so naturally integrated into every device that users feel it is simply a part of the computer. VLC is a good example; it became the default solution for playing almost any audio or video offline, so users rarely felt the need to look elsewhere. Another example I look up to is iLovePDF, which made working with PDFs effortless by putting almost every useful tool under one roof.

I want Kivi to combine both ideas: an offline-first infrastructure that is so reliable it becomes a natural part of the device, and a powerful set of tools that makes users feel safe knowing Kivi can reduce the impact of human errors in the things they do.
